

# Quality Control and Assurance

LECTURE 4

# Learning objectives: Precision, Quality Control, Quality Assessment and Cross Calibration

Phobias and Irrational fears

Precision, Quality Control, Quality Assessment and Cross Calibration

# **DXA Quality Control Processes**

#### Instrument QC

**Pre-Scan calibration** 

Weekly phantom scanning

Monthly phantom scanning

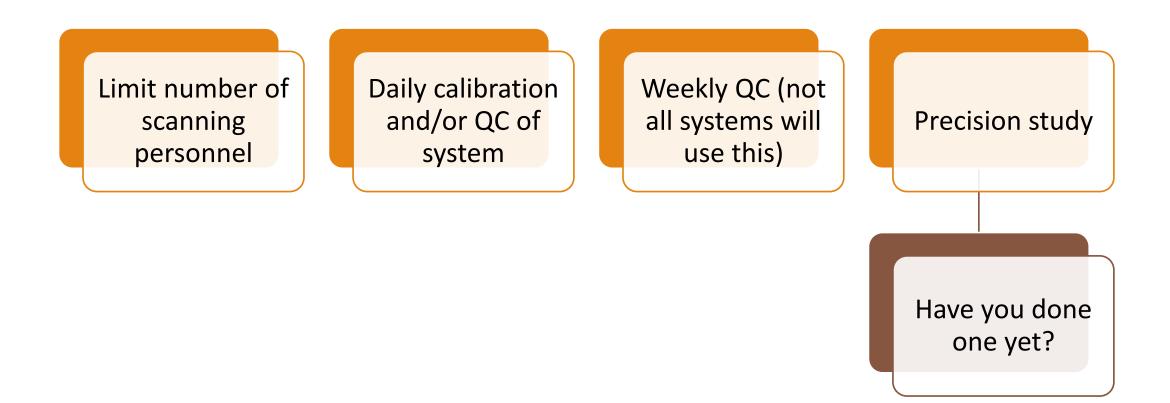

Service log entries

Scanner preventative maintenance by manufacturer

Precision testing by the technologist

You must scan patients on a scanner with a database that represents their demographics. Therefore, it is imperative that you do the DXA scans preferably at the same clinic, same scanner, using the same technologist every time.

# **Optimum Situations**

# Limiting Personnel

"looks good on paper"

Not always practical in today's world

Try to match tech to machine to patient

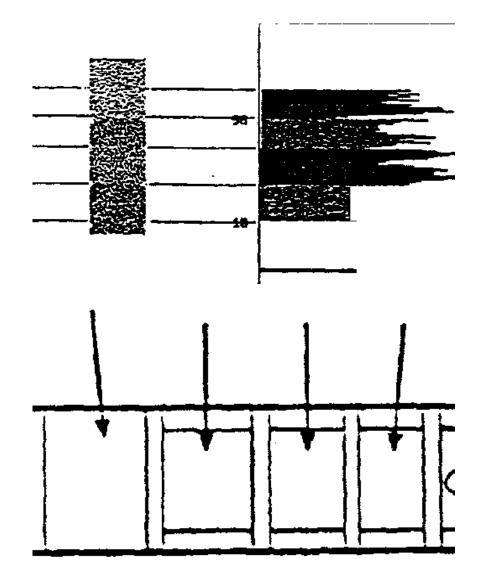

Try to be consistent in scanning protocols by setting down rules for facility

• You should have written work instruction

#### Daily Calibrations

All DXA scanners utilize some kind of consistent calibration tool.

- Calibration box
- Anthropomorphic spine phantom
- Step-wedge phantom

# Phantoms/Standards

Step-wedge

# Phantoms/Standards

Anthropomorphic phantom

Resembles anatomy which is being evaluated

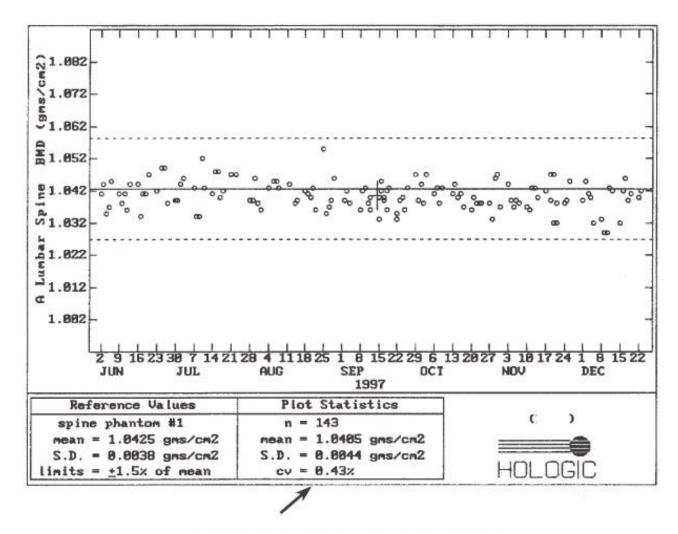

#### Results from Phantom Scan

#### Area measurement

- Bone Mineral Content (BMC)
- Bone Mineral Density (BMD)

#### BMD is plotted on QA graph

This BMD should fall +/- 1.5 % of established BMD of system

Copyright © 2003, Mosby, Inc. All Rights Reserved.

# Results from Phantom Scan

#### Results from Phantom Scan

What do you do with this information?

- Print the QC scan
- Check this printout
- Initial or sign off on it
- Place in QC book for facility
- These steps document you are visualizing your QC Scan and not just running them to get going on your day.

#### Daily Calibration Process

# "Wakes up the machine"

# Verifies and evaluates:

- Internal machine mechanics
- Electronics of scan table
- Function of laser light
- Detector system for the dual beam
- CV for the scan

# Daily Calibration-GE Lunar

#### QUALITY ASSURANCE RESULTS

# Where does the baseline come from?

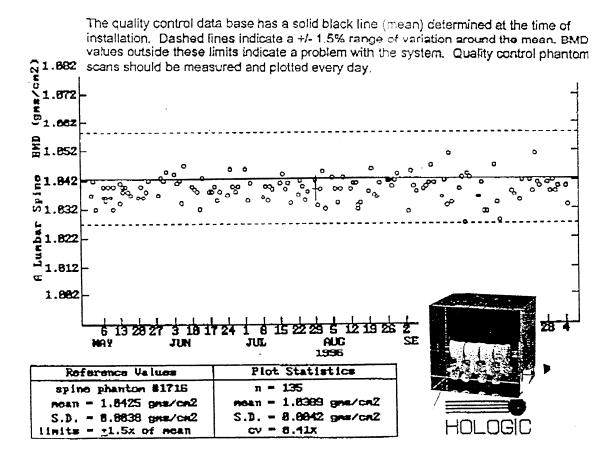

Machine is brought to facility

## Taken out of boxes and assembled

### Baseline scans are performed

- Typically, 10 phantom scans without repositioning phantom
- Scans are averaged to produce a mean
- Range of performance or CV is calculated from mean
- Data is entered by engineer into system

#### Quality Control Hologic 2000

# Scan QC Information Baseline

#### A.H.E.C.

28

What can change from day to day?

Operators The patient

Machine performance or fluctuation

Changes in phantom measurements

# Measuring Precision

BMD can vary due to:Site measuredPA LumbarHip

• Forearm

#### Measuring Precision

#### Type of densitometer

- Manufacturer
- Model of machine
- Age of Software

## Operator

• Experienced vs. Inexperienced

Method of measurement

• RA, DXA, QCT, QUS

#### Precision Study

#### What is accuracy?

- When does it occur?
- How is it affected?

What is precision?

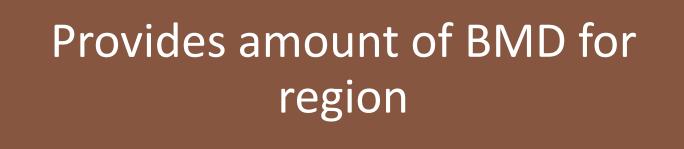

- When does it occur?
- How do we measure it?

Does the BMD measurement produced by your machine reflect the true value of your patient's BMD

Or-"Do you have what we say you have?

Would it match results from a core biopsy of your patient?

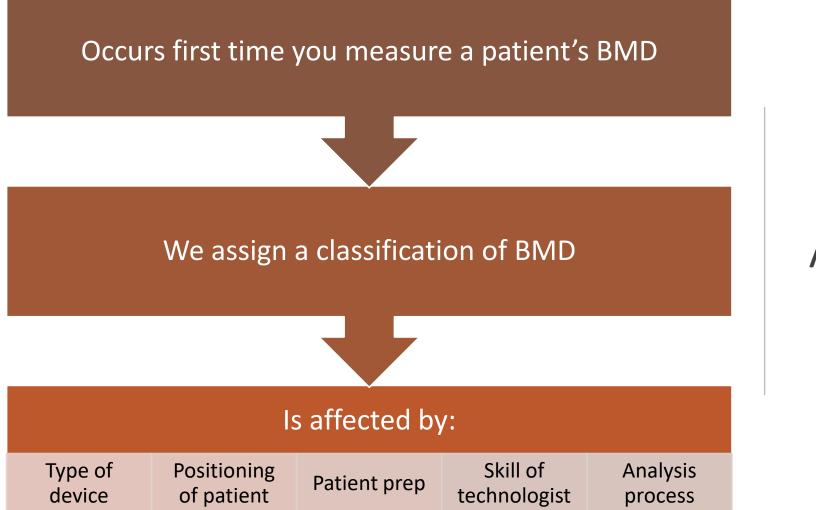

#### Accuracy

#### Allows us to assign

**T-Score** 

Accuracy

## Accuracy

# Accuracy

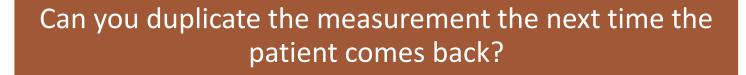

Do you ever drop the ball in some of these critical areas?

Sure, we do

What can you do differently?

- Get some training
- Make changes as you grow in your skills

Look at previous scans

Compare them for performing your analysis

Duplicate, duplicate, duplicate

## Precision

Types of Precision Studies

#### In Vitro

- Related to design of instrument
- Appropriate and timely maintenance of system
- Evaluated using a phantom

#### In Vivo

- Based upon operator skills
- This can be more difficult to measure
- Uses live subjects, not a phantom

#### Precision Occurs

When patient returns for serial measurements

Involves an in-house precision study

Perform one in your facility prior to doing follow-up measurements

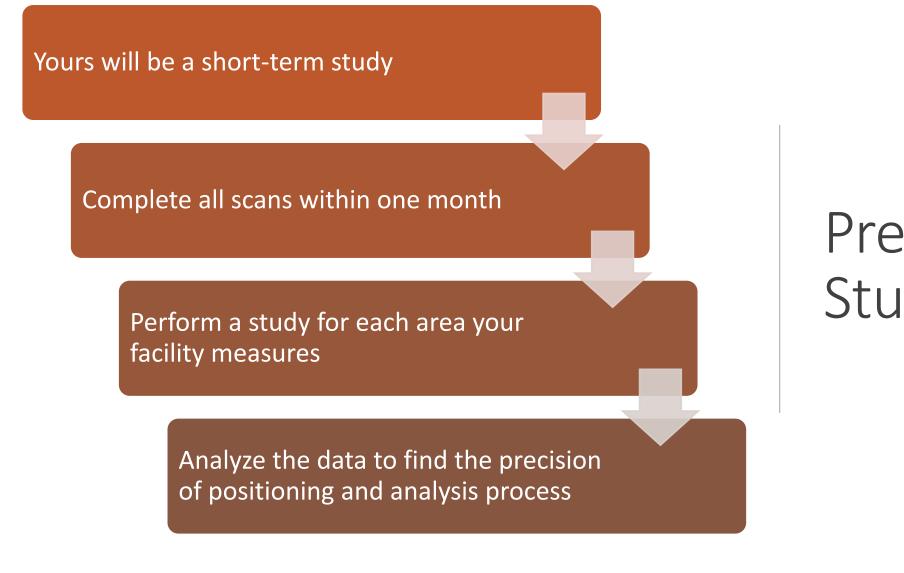

#### Precision Study

\*\*\*Make sure it is legal in your state to perform study with live subjects

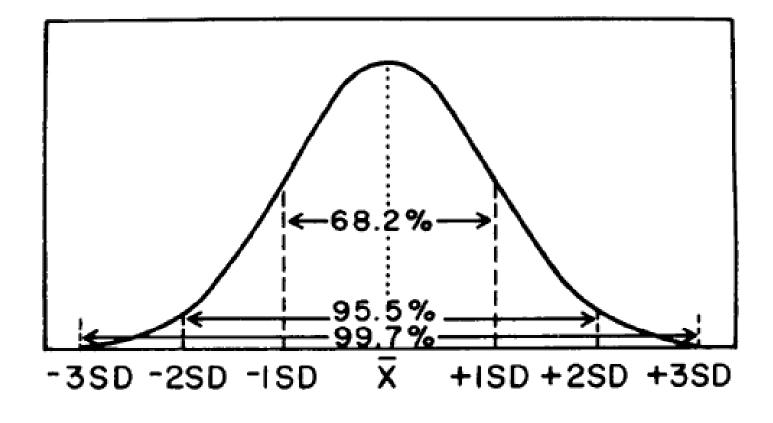

# Document the patient has consented to be involved in study

Develop a document for your facility which the patient will sign verifying they understand the following:

- They will be participating in a study
- They will receive some additional exposure with additional scan

# Precision Study

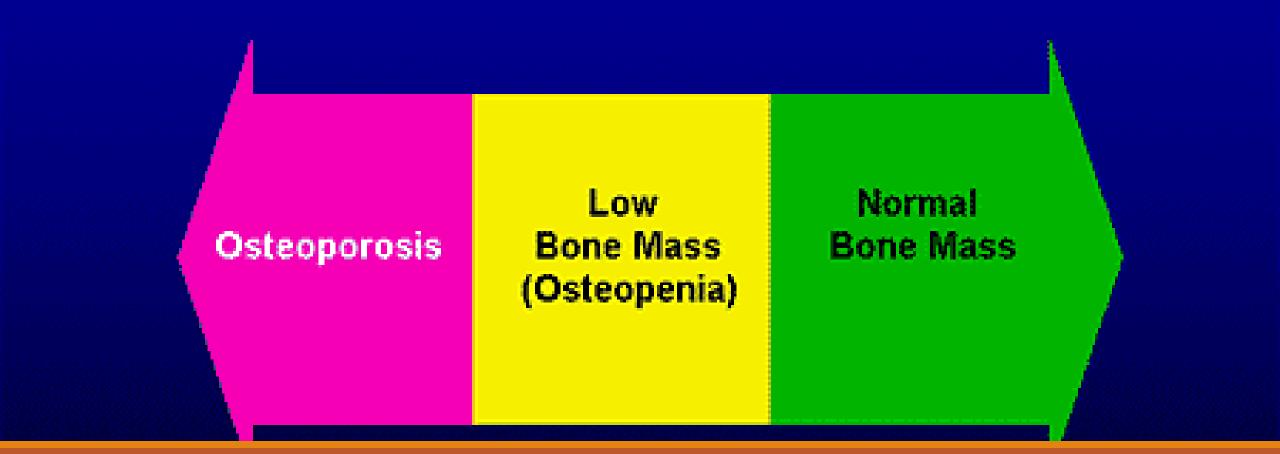

Mean

 Average value of a group of measurements

Standard Deviation (SD)

 Standard variation or deviation from mean value

#### Correlates with life time fracture risk for Caucasian Women

#### How is the SD used in BMD?

CV

#### Coefficient of Variation (CV)

- SD as expressed as a percentage of the mean
- CV= 100 X (SD/Mean)

Smaller CV, the better the precision of the result or value

#### I.E.- a CV of 2% is better than 5%

# Why should we measure precision?

### Doesn't the manufacturer do it?

## Can't I use their data?

#### Manufacturers uses:

- Phantoms or healthy individuals
- Highly skilled technologists

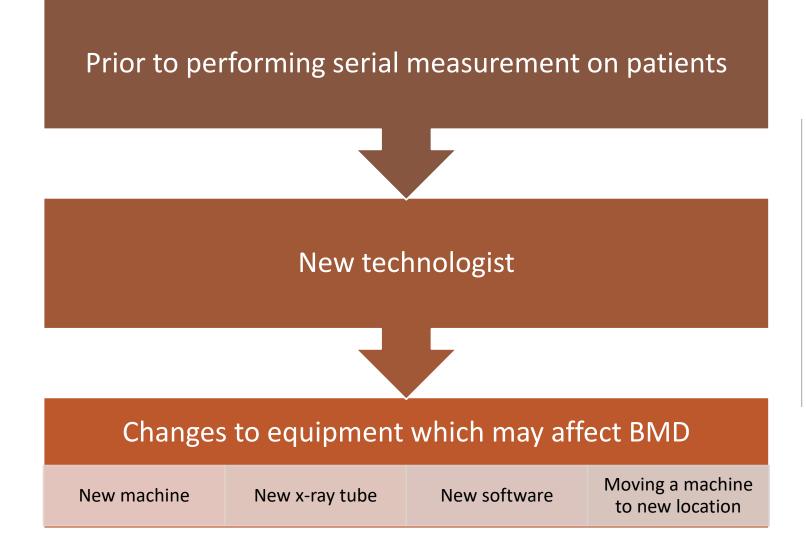

What's happening in my facility?

# Older patients

- Degenerative changes
- Medication changes
- Loss of a site to measure

Newer operators

- Learning the ropes
- Do not know all the ins and outs of machine

When do we measure precision?

# How do we do it?

#### Within one month

Same technologist

Same site

- 30 patients -2 times
- 15 patients -3 times

The individual values and the average value for each of the 3 scans on patients 1 thourgh 14 are shown in table 1.

PATIENT	SCAN 1	SCAN 2	SCAN 3	MEAN (X)
Patient 1	1.010	1.019	1.100	1.043
Patient 2	0.925	0.940	0.918	0.928

# How do you use the data?

Take the precision error for the site measured and subtract it from the amount of BMD change from the previous scan

This is your clinically significant BMD change.

# For example

If your BMD error for the system and your scanning personnel is:

5% error for the L-Spine 10% error for the Total Hip

# For example

Your patient's BMD in the L-Spine has changed 6.5% and 15% in the Total hip since the previous BMD measurement

How much of this BMD change is clinically significant?

# DXA Cross Calibration

# Machine Cross Calibration

Should be performed when adding a new DXA machine to your facility.

When replacing an old DXA scanner of the same manufacture.

When getting a software upgrade.

When replacing an x-ray tube (Use the precision study from the x-ray tube that went out).
